Year 2 Block E: Three 3-week units

Securing number facts, calculating, identifying relationships

- Finding half, quarter and three quarters of shapes and sets of objects
- Doubles of numbers to 20 and corresponding halves
- Counting on and back from different numbers in 2s, 5s and 10s
- Building up the 2, 5, or 10 times-tables
- Describing patterns and relationships involving numbers or shapes and testing examples that fit conditions
- Solving problems using counting, the four operations and doubling or halving in practical contexts, including measures or money
- Using the symbols +, -, ÷ and = to describe, record and interpret number sentences
- Multiplication as repeated addition and arrays
- Division as sharing and repeated subtraction (grouping)
- Using the symbols +, -, ×, ÷ and = to record and interpret number sentences involving all four operations; calculate the value of an unknown in a number sentence (e.g. \( \Box + 2 = 6, 30 - \Box = 24 \))
- Understand that halving is the inverse of doubling and derive and recall doubles of all numbers to 20, and the corresponding halves
- Derive and recall multiplication facts for the 2, 5 and 10 times-tables and the related division facts; recognise multiples of 2, 5 and 10
- Find one-half, one-quarter and three-quarters of shapes and sets of objects

Vocabulary

- problem, solve, calculate, calculation, inverse, answer, method, explain, predict, pattern, order
- place value, partition, ones, tens, hundreds, one-digit number, two-digit number, add, subtract, plus (+), minus (–), sign, equals (=), operation, symbol, number sentence, number line
- count on, count back, lots of, groups of, equal groups of, grouping, array, row, column, multiply, multiplication, multiplied by (×), multiple, share equally, divide, division, divided by (÷), remainder, round up, round down, double, halve
- fraction, part, equal parts, one whole, parts of a whole, number of parts, left over, fraction, one-half, one-quarter, three-quarters, one whole

Building on previous learning

Check that children can already:

- solve problems involving doubling or halving, combining groups of 2, 5 or 10, or sharing into equal groups
- count on or back in ones, twos, fives and tens and use this knowledge to derive the multiples of 2, 5 and 10 to the tenth multiple
- recall the doubles of all numbers to at least 10
- use the vocabulary of halves and quarters in context.
Year 2 Block E: Securing number facts, calculating, identifying relationships
Unit 1

Learning overview

Contained in this learning overview are suggested assessment opportunities linked to the Assessment focuses within the Assessing Pupils’ Progress guidelines. As you plan your teaching for this unit, draw on these suggestions and alternative methods to help you to gather evidence of attainment or to identify barriers to progress that will inform your planning to meet the needs of particular groups of pupils. When you make a periodic assessment of pupils’ learning, this accumulating evidence will help you to determine the level at which the pupils are working. To gather evidence against the three Ma1 Assessment focuses (problem solving, reasoning and communicating) it is important that children are given space and time to develop their own approaches and strategies throughout the mathematics curriculum as well as through the application of skills across the curriculum.

In this unit the illustrated assessment focuses are:

- Ma1, Problem solving
- Ma2, Numbers and the number system
- Ma2, Fractions

Children extend their understanding of counting on and back in steps of 1, 2, 5 and 10 from various start numbers. They record sequences and describe patterns in the numbers, including recognising odd and even numbers. In particular, they explain the patterns from counting in twos, fives and tens when starting from zero. They find missing numbers from sequences such as:

30, 40, □, 60, □ and 55, 50, □, 40, 35, □, 25, 20

Assessment focus: Ma2, Numbers and the number system

Look for the range of sequences for which children can find missing numbers or can continue forwards and backwards. Look for children working out how much the numbers increase or decrease with each step or recognising familiar sequences, for example from counting in tens.

Children work with others to explain their reasoning and to listen to the reasoning of others. They consolidate counting on from zero in steps of 2, 5 and 10 and build up these times-tables, describing what they notice about numbers in the tables. They use this to predict some other numbers that would be in the count and to answer questions such as:

What are four fives? How many twos make 18?

They use counting, practical equipment, diagrams or a number line to support, record or explain their answers.

Using practical equipment or objects as a starting point, children understand that repeated addition can be represented using the multiplication symbol. For example, they record four lots of five fingers as $5 + 5 + 5 + 5$ and use the multiplication sentence $5 \times 4$ to record this. They understand that ‘multiplied by 4’ or ‘× 4’ means ‘add the number four times’.

They use a number line to support repeated addition, recording the equal jumps on the line and writing the repeated addition statement and the matching multiplication statement. They become familiar with different ways of describing a multiplication:
For a given multiplication such as $2 \times 6$, children explain how jumps can be made on a number line. They point to the numbers as they make the jumps and provide a 'commentary' of what they are doing as they go along, explaining why this shows $2 \times 6$. They use arrays of pegs in pegboards, patterns on squared paper or hops on a number line to show that $3 \times 5 = 5 \times 3$ or that $4 \times 2 = 2 \times 4$.

**Assessment focus: Ma1, Problem solving**

Look for children engaging with practical mathematical activities and beginning to represent problems in different ways. For example look for children gaining insights into multiplication by representing it as counting, repeated addition as jumps along a number line, sets of objects and arrays of linking cubes. Look for children who represent a problem in one way but can suggest and use a different way. Look for children beginning to make connections, for example between arrays representing 2 fives and 5 twos or between arrays and corresponding jumps on a number line.

Children experience **division as grouping**. They use practical equipment or objects to answer questions such as: *How many 2s make 12?* They relate this to the division $12 \div 2$. They use objects or a number line to support, record or explain this. For example, starting from 12, they jump back in steps of 2, or starting with 12 counters, they keep on taking away 2 counters. They record this as **repeated subtraction** and as **division**:

\[
12 \div 2 = 6
\]

Children explain how they use equipment, objects or a number line to carry out division. Throughout the unit, children find **doubles** of numbers to 10 using practical resources or drawings to consolidate their understanding of doubling. They record using repeated addition and multiplication and find **inverse operations**, knowing, for example, that if double 7 is 14 then half of 14 is 7.

Children **find halves of shapes** by folding. They recognise that each part of the shape on either side of the fold line is **one-half** so that the whole shape is made up of two identical
halves. They explore different ways of finding half of shapes, for example folding squares in half in as many different ways as possible. They reinforce their understanding that the halves must be of equal size. They relate this to line symmetry.

Children fold shapes in half and then half again to make quarters. They know that four quarters make one whole and that each quarter must be the same size.

**Assessment focus: Ma2, Fractions**

Look for evidence of children understanding halves and quarters in a range of contexts. For example, look for children finding different ways to fold and cut a square in half or into quarters. Notice if children can reassemble the square using the smaller squares or the triangles that are its quarters. Look for children using the strategy of halving and halving again in the context of finding a quarter of a set of objects that they can move. Notice how children solve the problem of finding a quarter of a number of objects in a picture. Look for children using cubes to represent the objects in the picture. Look for those children who draw a line through the picture so that the same number of objects appears on either side of it, and repeat the process to find one quarter.

Children consolidate finding halves and quarters of a group of objects, by giving an equal number of objects to each of two or four people by sharing out the objects equally among the people. They reinforce this idea in practical situations such as:

- placing 14 dots on a ladybird so that the same number of dots is on each half;
- placing 12 'tomatoes' on four plates so that each plate has the same number of tomatoes.

In a group, children sort a set of numbers into those that can be halved exactly and those that cannot. They discuss their findings and discover that when they halve a set of objects there may be one left over. They relate this finding to even and odd numbers, noticing that the numbers that can be halved exactly are those that they land on when they count in twos from zero along the number line.

Year 2 Block E: Securing number facts, relationships and calculating
Unit 2

Learning overview

Contained in this learning overview are suggested assessment opportunities linked to the assessment focuses within the Assessing Pupils’ Progress guidelines. As you plan your teaching for this unit, draw on these suggestions and on alternative methods to help you to gather evidence of attainment, or to identify barriers to progress that will inform your planning to meet the needs of particular groups of children. When you make a periodic assessment of children’s learning, this accumulating evidence will help you to determine the level at which they are working. To gather evidence related to the three Ma1 assessment focuses (problem solving, reasoning and communicating), it is important to give children space and time to develop their own approaches and strategies throughout the mathematics curriculum, as well as through the application of skills across the curriculum.

In this unit the illustrated assessment focuses are:

- **Ma1, Communicating**
- **Ma2, Written methods**
- **Ma2, Operations and the relationships between them**

Children know doubles of numbers to 10 and the related halves. They record calculations, using × 2 and ÷ 2. They use these facts to find doubles of numbers to 20, using partitioning. For example, they double 15p, using 10p and 5p coins and matching each coin with an identical coin.

They halve amounts of money in a similar way, replacing two coins of the same kind by one coin. If there is only one coin of a particular type, they replace it with smaller coins of equivalent value, for example replacing a 20p coin with two 10p coins.

Children recognise and write the fraction notation for \( \frac{1}{2} \) and \( \frac{1}{4} \). They fold shapes in half and then in half again to make quarters. They know that four-quarters make one whole and that each quarter must be the same size.

Children consolidate finding half of a set of objects and recognise that finding half of a number is the same as dividing it by 2. They find a quarter of a set of objects by sharing them equally among four. For example, they share a set of objects equally among four children and establish that each child has one quarter, or they share 12 ‘tomatoes’ equally onto the quarters of a ‘pizza’ and count what one quarter of 12 is. They use the appropriate vocabulary related to halves and quarters.

Children establish multiplication and division facts for the 2, 5 and 10 times-tables by counting in twos, fives and tens. If necessary, they use practical apparatus, counting or drawing to support them. They respond to questions such as:

- **Count on seven twos. Where do you finish?**
- **What are eight fives?**
They use **patterns and relationships** to support their learning of these facts. For example, they remember that all numbers in the 2 times-table are even and that numbers in the 5 times-table must end in 0 or 5. Children chant the tables in unison, using rhythm and the patterns of words to help them to commit facts to memory. They say:

*One five is five.*

*Two fives are ten.*

*Three fives are fifteen...*

so that the answer to *How many 5s make 30?* relates closely to the wording.

Chanting of tables is supported with a counting stick or number line. This helps to establish the relationship between the increasing steps and corresponding products.

Occasional chanting of division tables can help to establish both the knowledge of division facts in their own right and the use of the phrase ‘divided by’. For example:

*Five divided by five is one.*

*Ten divided by five is two...*

Children **relate division to multiplication**. For example, they recognise that one way to understand 30 ÷ 5 is as:

*How many 5s make 30?* and use the 5 times-table to answer this.

**Assessment focus: Ma2, Operations and the relationships between them**

Look for evidence of children recognising that division is the inverse of multiplication, and that halving is the inverse of doubling. Look for children who use inverses to create related number facts – for example, given 7 × 5 = 35, they create 5 × 7 = 35 or 35 ÷ 5 = 7 – and look for those who use inverses to solve problems such as: ‘I think of a number, double it and add 5. What was my number?’

Children use their knowledge of multiplication and division facts to answer **simple word problems** such as:

*Seven pairs of socks go in the wash. How many socks is this?*

*How many 5p coins are needed to make 45p?*

*What is the next multiple of 5 after 25?*

They **record the necessary calculation**, using the appropriate symbols.

**Assessment focus: Ma1, Communicating**

Look out for children discussing their work and referring to the practical materials they have used to help them describe what they have done. Look for children who talk about their approach, engaging with other children’s ideas and using mathematical language. Look for children using symbols and mathematical diagrams to record their work.

Children use **sharing** to answer division questions; for example, they find 24 ÷ 3 by sharing 24 counters equally into 3 pots. They experience divisions that give rise to remainders, such as:

*Three friends share 16 marbles equally. How many marbles does each friend get? How many marbles are left over?*

Children **tell division and multiplication stories** to accompany calculations such as 20 ÷ 5, 4 × 10.
Assessment focus: *Ma2, Written methods*

Look out for children recording their mental calculations as number sentences, and for the recording that children use for examples they cannot complete in their heads. When children are solving word problems that involve multiplication and division, look out for the diagrams and jottings they choose to use. Look for evidence of children using numbers on a number line or in a 100-square to support their calculation, and for children who begin to draw an empty number line as the basis of a written method.
<table>
<thead>
<tr>
<th>Objectives</th>
<th>Assessment for Learning</th>
</tr>
</thead>
</table>
| Identify and record the information or calculation needed to solve a puzzle or problem; carry out the steps or calculations and check the solution in the context of the problem  
I know what I need to do to help me solve a problem and then I can work out the answer  
I can show how I solved a problem or puzzle and explain steps in my working | What do you need to find out? How do you know that you need to add/multiply/double/halve?  
What helped you to decide how to do this calculation? Could you do it another way?  
Tell me how you solved the puzzle.  
Why did you write that number sentence? Is there another way you could write it?  
Write as many different ways as you can of making 12.  
Record your working so that a friend can follow it.  
How could you check that you have found all the possibilities? |
| Solve problems involving addition, subtraction, multiplication or division in contexts of numbers, measures or pounds and pence  
I can use calculations to solve problems and I know which calculation to use | How did you know it was a multiplication/division?  
How did you work it out?  
If you had three 5p coins, how much money would you have? How could you write that down? What sort of calculation is it? What if, instead of three 5p coins, you had four 5p coins. How would your number sentence change? How would the answer change?  
Make up a story that would mean that you need to work out:  
15 + 24, 18 ÷ 3, 9 × 5. |
| Represent repeated addition and arrays as multiplication, and sharing and repeated subtraction (grouping) as division; use practical and informal written methods and related vocabulary to support multiplication and division, including calculations with remainders  
I can use sharing to work out divisions and can explain what I did | Suppose 15 pencils were to be shared out between three children. How many pencils would each child get? Explain to me how you could work it out.  
Explain to me how you would work out 20p divided equally among five people. How could you write it down?  
What about 18 sweets between two people? How many more sweets would you need to give them 10 sweets each?  
How many £2 coins do you get for £20? How do you know? |
| Use the symbols +, −, ×, ÷ and = to record and interpret number sentences involving all four operations; calculate the value of an unknown in a number sentence (e.g. □ + 2 = 6, 30 − □ = 24)  
I know how to write number sentences for multiplication and for division  
I can explain what different number sentences mean | Show me on the number line what 3 × 8 would look like.  
What about 5 × 8? How different would 8 × 5 look on a number line?  
I have 20 counters here. Show me what 20 ÷ 5 means with these counters.  
Explain how you worked out the missing number in this number sentence:  
24 + □ = 6  
Make up some ’missing-number’ problems for others to solve. |
**Year 2 Block E: Securing number facts, calculating, identifying relationships**

- Understand that halving is the inverse of doubling and derive and recall doubles of all numbers to 20, and the corresponding halves  
  *I know some of my doubles up to 20*  
  *I can work out the rest and some others too*

  Which doubles do you just know?  
  What number must I double to get 10? 16? 22?  
  I double a number and get 20. What number did I start with?  
  You know that double 15 is 30. How could you use this to work out double 16? What about double 17? What about double 14?  

- Derive and recall multiplication facts for the 2, 5 and 10 times-tables and the related division facts; recognise multiples of 2, 5 and 10  
  *I know some of my times-tables for 2, 5 and 10*  
  *I can use counting or other strategies for those I don't know*  
  *I know that multiples of 5 end in 5 or 0*

  What tips would you give someone who had forgotten the 10 times-table?  
  How could you use a 10 times-table fact such as $10 \times 6 = 60$ to work out a 5 times-table fact such as $5 \times 6 = 30$?  

- Find one-half, one-quarter and three-quarters of shapes and sets of objects  
  *I can find a half or a quarter of a set of objects*  
  *I can fold a piece of paper into halves or quarters*

  How could you find one-quarter of a piece of string?  
  What about a quarter of two pieces of string?  
  Here is a set of 12 pencils. How many is a quarter of the set?  
  Shade one-quarter of this shape.  

- Listen to a talk by an adult, remember some specific points and identify what they have learned  
  *I can remember how to work out a sharing problem*

  When we share a number of cherries equally among several people, we give out the cherries one by one, saying: 'one for you, one for you', and so on, until the cherries are all used up.  
  Sometimes there are some cherries left over, because there are not enough to go round once more.  
  Explain to your partner how you would share 13 cherries equally among four people. How many cherries would be left over?
Year 2 Block E: Securing number facts, relationships and calculating
Unit 3

Learning overview

Contained in this learning overview are suggested assessment opportunities linked to the assessment focuses within the Assessing Pupils' Progress (APP) guidelines. As you plan your teaching for this unit, draw on these suggestions and alternative methods to help you to gather evidence of attainment or to identify barriers to progress that will inform your planning to meet the needs of particular groups of children. When you make a periodic assessment of children's learning, this accumulating evidence will help you to determine the level at which they are working. To gather evidence related to the three Ma1 assessment focuses (problem solving, reasoning and communicating), it is important to give children space and time to develop their own approaches and strategies throughout the mathematics curriculum, as well as through the application of skills across the curriculum.

In this unit the illustrated assessment focuses are:

- **Ma1, Reasoning and Communicating**
- **Ma2, Mental methods**
- **Ma2, Fractions**
- **Ma2, Solving numerical problems**

Children understand and use arrays to represent *repeated addition/multiplication*. They use counters on a grid to represent '7 lots of 2' and use this to find the answer of 14.

![Array with counters](image)

They use pegboards to create arrays where rows/columns are in different colours. They record the calculation this represents, using repeated addition and multiplication. They explain how an array helps to show multiplication, pointing to the rows and/or columns to describe how they work out the total number of dots/counters to find the answer to the multiplication.

**Assessment focus: Ma1, Reasoning and Communicating**

Look for evidence of children referring to their record of what they did in order to explain their results and how they know an answer is correct. Look for children who use their reasoning about a problem to respond to 'What if…?' or 'What if… not…?' questions.

Children derive and **learn to recall multiplication and division facts for the 2, 5 and 10 times-tables**. They use these facts to respond to oral and written questions such as:

\[
40 \div 5
\]

*What is double 8?*

*How many 10s make 90?*

*Half of a number is 6. What is the number?*

They become more proficient with using multiplication and division facts to calculate the missing number in number sentences such as:
Assessment focus: *Ma2, Mental methods*

Look for evidence of the mental methods children use as they solve problems, for example, look for children who know and can recall multiplication facts rather than counting in steps of 2, 5 and 10.

Children find **doubles of numbers to 20 and corresponding halves** and explain their method. They secure their understanding of finding half and quarter of shapes and sets of objects. They count the quarters 'one-quarter, two-quarters, three-quarters, four-quarters', and use this to recognise that four-quarters are the same as one whole and that two-quarters are the same as one-half. They shade three-quarters of shapes, recognising and recording the fraction notation $\frac{3}{4}$.

Children find **halves and quarters of groups of objects**, using practical apparatus or diagrams or using knowledge of doubling/halving facts. They find quarters of groups of objects by, for example, sharing objects fairly into the quarters of a circle and use this to find the **number of objects in three quarters**.

Assessment focus: *Ma2, Fractions*

Look for evidence of children making a connection between halving shapes and halving quantities. Look for children who recognise and record three-quarters in different contexts, for example, those who identify the container that is about three-quarters full or the shape that has three-quarters shaded.

Children solve problems involving multiplication and division, representing the information, using apparatus or diagrams. They record the calculation using appropriate symbols. For example:

Patti bought five stickers and paid 30p. The stickers were all the same price. How much did each sticker cost?

A bus ticket costs 25p. How much will five of these tickets cost?

It costs 75p for a child to go swimming. How much does it cost for two children?

Ella’s dad washes some cars. He uses 12 buckets of water. Each bucket has 5 litres of water. How many litres of water does he use altogether?

Ten children can sit at one table. There are 43 children. How many tables are needed so that each child can sit at a table?

A carton of orange fills 6 cups. Mrs Green wants to fill 50 cups with orange. How many cartons of orange does she need to buy?

They also solve puzzles such as:

I have only one sort of coin in my purse. I have 20p. Find different ways that this is possible.

What is the least number of coins that you need to make 97p?

Children identify the operation(s) needed to solve the problem and explain reasoning. They relate the answer found back to the situation and check that it makes sense.
Assessment focus: Ma2, Solving numerical problems

Look for evidence of children responding to a range of oral and written language used to describe a problem, and deciding what information and operations to use. Notice how children represent a problem that involves finding the total of several groups of the same size. Look for children who choose to use an array of counters to represent the problem, or who use repeated addition. Look for those children who are beginning to use multiplication to represent the problem. As they solve division problems, look for children who are beginning to make sense of remainders. Notice if they identify ‘how many are left’ or make sensible decisions about rounding up or down, depending on the context.
### Objectives

**Children's learning outcomes are emphasised**

<table>

<tbody>
<tr>
<td>Sam goes to the shop for some buttons. There are two red buttons and four blue buttons on each card of buttons. How many buttons are there on ten cards? What do you need to find out? What was the question that you were asked? So does your answer make sense? Could 20 be the answer? Or 40? How do you know? There are 15 apples in a tray. Ling has 4 trays of apples. How many apples does Ling have altogether? Show how you work it out.</td>
</tr>
</tbody>
</table>

| Kiz worked out the answer to $7 \times 3$ on a number line. Show how Kiz could have worked out the answer on this number line. Mr Bell had three pots with four crayons in each pot. How many crayons did he have altogether? Which one of these would you use to work out the answer to the question? A $4 + 4$ B $3 + 3$ C $4 \times 3$ D $3 + 4$ Sita worked out the correct answer to $9 \times 5$. Her answer was 45. Show how she could have worked out her answer. Harry worked out the correct answer to $20 \div 5$. His answer was 4. Show how he could have worked out his answer. |

| Explain how you work out how many dots there are without counting them all. Here are 20 counters. How could you arrange them in equal rows? How could you use a number sentence to show your arrangement? $4 + 4 + 4 + 4 + 4 = 20$ Write this addition fact as a multiplication fact. $\square \times \square = \square$ |

### Assessment for Learning

- Identify and record the information or calculation needed to solve a puzzle or problem; carry out the steps or calculations and check the solution in the context of the problem.
  *When I have worked out the answer to a problem I can look again at the problem and then check that the answer makes sense.*

- Present solutions to puzzles and problems in an organised way; explain decisions, methods and results in pictorial, spoken or written form, using mathematical language and number sentences.
  *I can explain how I worked out the answer to a problem and can show the working I did.*

- Represent repeated addition and arrays as multiplication, and sharing and repeated subtraction (grouping) as division; use practical and informal written methods and related vocabulary to support multiplication and division, including calculations with remainders.
  *I can use arrays to help me work out multiplication. I can do multiplication and division in different ways and show how I do them.*
### Year 2 Block E: Securing number facts, calculating, identifying relationships

#### 1. Use the symbols +, −, ×, ÷ and = to record and interpret number sentences involving all four operations; calculate the value of an unknown in a number sentence (e.g. \( \Box ÷ 2 = 6, \) \( 30 − \Box = 24 \))

**I can work out the missing numbers in number sentences**

When I think I have the answer, I can put it in the number sentence and check whether it is correct

What could the missing numbers be?

| \( \Box \) × \( \Diamond \) = 20 |
| \( \Box ÷ \Diamond = 5 \) |

How can you record the solution to this problem?

I am thinking of a number. I divide it by 5 and the answer is 3. What is my number?

Make up some ‘missing-number’ problems for others to solve.

#### 2. Understand that halving is the inverse of doubling and derive and recall doubles of all numbers to 20, and the corresponding halves

**I can double all numbers up to 20 and can find matching halves**

I’m thinking of a number. I’ve halved it and the answer is 15. What number was I thinking of?

I’m thinking of a number. I doubled it and the answer is 28. What number was I thinking of? Explain how you know.

Write the missing numbers.

- 5 → double and add 3 → \( \Box \)
- 8 → double and add 3 → \( \Box \)

There are 30 children in a classroom. Half of them are girls. How many are boys?

Mina has 32 stickers. She gives half to her brother. How many stickers does she give him?

#### 3. Derive and recall multiplication facts for the 2, 5 and 10 times-tables and the related division facts; recognise multiples of 2, 5 and 10

**I know my 2, 5 and 10 times-tables**

**I can work out divisions that go with the tables**

Write the missing numbers in the boxes.

\( 5 \times 4 = 10 \times \Box \)

\( \Box \times 5 = 50 \)

Write the answer:

\( 45 ÷ 5 = \Box \)

Draw rings around all the multiples of 5.

<p>| 45 | 20 | 54 | 17 | 40 |</p>
<table>
<thead>
<tr>
<th>Task</th>
<th>Example Activity</th>
</tr>
</thead>
</table>
| Find one-half, one-quarter and three-quarters of shapes and sets of objects.  
*I can find three quarters of a set of objects or of a shape* | Take 20 counters. Can you show me one-quarter? Two-quarters? Three-quarters? Four-quarters? What do you notice? Can you write that down in some way?  
Here is a set of 12 pencils. How many is a quarter of the set? How many is three quarters?  
Find three-quarters of 20 biscuits. Three-quarters of 24 buttons.  
How will you find one-quarter of that rectangle? Three-quarters?  
If one-quarter of a set of shells is 2, how many shells are in the set?  
Here is a pizza cut into eight equal pieces. How many pieces are needed for three-quarters of the pizza?  
What is half of this amount? |
| Adopt appropriate roles in small or large groups and consider alternative courses of action.  
*I can work in a group and help the group to think about different ways to do things* | There is plenty of squared dotty paper. In your group, discuss how to divide this shape into four equal parts. |
